

ABSTRACT

A sealed container system for packaging and displaying a live plant for sale. The system has a subcontainer that is partially filled with a hydrogel, or has a divider lid that separates the hydrogel from the rest of the container system. A lid covers the

5 subcontainer, where the lid has a tapered or elongate lumen to accommodate the plant roots while preventing the leakage of the hydrogel. The clear or transparent container, with the hydrogel, allows the container to operate as a miniature greenhouse allowing the plant to be displayed for an extended period of time without the need for interventional care by a human.
